Porous PTFE membrane used for sepn. - is obtd. by forming a mixt of resin
and filament forming polymer, heat treating and removing polymer

Patent Assignee: TORAY IND INC (TORA)

Abstract (Basic): WO 8900879 A

The radius of the sepg. hollows in the membrane is specified to be 0.01 - 2 microns. The PTFE resin can be TFE homopolymer, a TFE-perfluoroalkylvinylether copolymer, a TFE-hexafluoropropylene copolymer, a TFE-ethylene copolymer or a mixt. of these.

It is specified that the polytetrafluoroethylene resin has no fibrillised part but is only composed of an organisation of combined resin particles. Prod'n. of membrane comprises i) forming a mixture of a dispersive soln. of PTFE resin and a filament forming polymer into a membrane having hollows or a sheet-shaped membrane. ii) This membrane is heat-treated at the melting temp. of the resin or higher. iii) The filament forming polymer is removed.

The dispersion solution of PTFE is specified to be an aqueous solution. The particle size of the resin in the dispersion solution is 1 micron or less. The separating apparatus is made of the porous hollow filament membrane of PTFE seated at the terminals with a fluoride resin such as vinylidene fluoride resin etc. Prod'n. of sepg. appts. comprises i), ii), iii) and additionally iv) encasing the membrane and seating it with fluoride resin using a melt-fixing method.

USE/ADVANTAGE - This process enables porous polytetrafluoro-ethylene resin membranes with various pore sizes and void ratios to be produced by adding different kinds or amounts of additives to the starting mixture. Providing a new technique for separating substances at high temperatures and in strongly decomposing or dissolving media.

0/23

Abstract (Equivalent): EP 343247 B

A porous hollow fibre membrane comprising, at least as its main component, a polytetrafluoroethylene resin particle bond structure substantially devoid of a fibrillated portion. (Dwg.0/23)

Abstract (Equivalent): US 5158680 A

The porous film membrane consists of a layer of a porous PTFE resin (I) particle bond structure devoid of a fibrillated portion, having pores 0.01-2 microns in size, and is formed by spreading a film-formable mixt., comprising an aq. or organic dispersion formed by emulsification polymerisation contg. surfactant, on a flat plate or continuous belt and then coagulating.

Pref. (I) is from tetrafluoroethylene homopolymer, a tetrafluoroethylene-perfluoroalkylvinyl ether copolymer, a tetrafluoroethylene-hexafluoropropylene copolymer a tetrafluoroethylene-ethylene copolymer and mixts. of them.

USE - Membranes for ultrafiltration, micro-filtration, etc. are mfd. by the process. (Dwg.0/23)t
